The Minority Report · FarajaMH

1 Utterance and context

- Original wording · language or dialect · setting
- Keep the source-language record
- No translation before interpretation

Illustrative example
“Moyo wangu unaniuma”
Synthetic context: grief and reported chest discomfort

2 Identify expressions

- Extract each expression as a span
- Keep full context; reviewers may correct boundaries
- Steps 3–7 run once per expression

Illustrative example
Span: “Moyo wangu unaniuma”
Retain grief and chest-discomfort context

3 Model interpretations

Model A · Model B · Model C · + more

- Separate calls before dictionary exposure
- Model and prompt versions pinned
- Literal translation · meanings · category · evidence
- Confidence recorded, never used for routing

Illustrative example
Model A (mock): emotional pain
Model B (mock): possible chest pain
Model C (mock): context unclear

4 Dictionary evidence

- Digital, versioned idiom library
- Proposed seed: FarajaMH workshop library
- Meaning · category · context limits · source

Evidence source, not a vote

Illustrative example
Mock entry: emotional pain
Check applicability to this speaker and context

For each expression, steps 3–7 repeat

5 Compare and route

- Model–model: Do the models agree?
- Model–dictionary: Do they match the library?
- Check category and applicability: negation · experiencer · time
- Review all disagreements, all safety flags and a random sample of agreed cases
- Other agreed cases: unreviewed; no approved mapping or export

Illustrative example
Emotional vs physical reading
Speaker · not negated · current

⚠ **Chest-pain concern: assess separately**

Selected for review

6 HITL Review: meaning

- Reviewer: meaning and category
- Safety assessment remains separate
- Second opinion when needed
- Unresolved meaning → request context
- Qualified reviewers

Illustrative example
Illustrative approved meaning: emotional pain linked to grief
Chest-pain concern still requires separate assessment

Approved meaning

7 Terminology lookup

Automated candidates

- From the terminology service, using the approved meaning
- Sources: MFOEM · MFOMD · SNOMED CT · LOINC (PHQ-9/GAD-7 items) · OMOP standard vocabularies

Terminologist sign-off

- Exact, close or related match · record a gap · defer
- A local concept can remain without an external match.

Illustrative example
Query: emotional pain linked to grief
External match pending
Related item ≠ questionnaire score

Record decision

8 Record and outputs

- Versioned decision recorded
- SSSOM (versioned): relation · justification · provenance
- Suitable validated mappings → OMOP
- Custom, non-standard local IDs > 2,000,000,000
- Optional export when required

Illustrative example
Retain reviewed local meaning
No external mapping or export while pending
Mappings are not patient outcomes

Reviewer corrections (steps 6–7) → curator approval → new dictionary version (no automatic overwrite)

Dictionary evidence ≠ model vote · **Model agreement ≠ correctness** · **Concept mapping ≠ diagnosis**

Illustrative example: the context, dictionary entry, model outputs and review are invented; Swahili readings and codes need verification.

No real patient data in consumer chatbots. Proposed design: not yet adopted or implemented.
